PLATEAU ELECTRIC GAS LINE

RELOCATING DISTRIBUTION LINES IN EAST TENNESSEE

SERVICE: Distribution

LOCATION: Tennessee

DATE: Spring 2025

SCOPE: Relocating 156 distribution poles to make way for a proposed pipeline.

Service Electric crews worked to relocate distribution lines across Morgan and Scott counties in Tennessee, to support the Ridgeline Expansion Project. This multi-month job involved relocating 156 distribution poles to make way for a proposed pipeline—a project that spanned rural areas and rugged terrain.

The pipeline itself was developed to support TVA's transition from coal to gas-fired generation at the Kingston Plant. The project will stretch approximately 110 miles across multiple counties and provides up to 300 million cubic feet of natural gas per day to the Kingston facility. While Service Electric didn't construct the pipeline, our crews played a critical role by clearing the way and relocating the existing distribution infrastructure.

Despite challenging conditions at times, the team stayed agile, and made steady progress while upholding Service Electric's high standards for safety and quality.
